

The **C**ontinuous **A**mbient **T**emperature (CAT) Monitor is an Adafruit Feather Huzzah-based temperature/humidity data logger with WiFi connectivity, capable of serving the data to a web page on the internet.

When the family cat was recently exiled to the outdoors for feline felonies committed within our house, our concern for his comfort led to this project's conception. Now, anyone in the family can view the temperature of his external domicile (insulated dome-shaped pet retreat fitted with a 60-watt heating pad), from anywhere and anytime.
